

# Pick's Theorem

Given a polygon  $P$  determined by a sequence of integer grid points we define

$i(P)$  = number of integer grid points strictly inside  $P$

$o(P)$  = number of integer grid points on boundary of  $P$

examples

$$\begin{aligned}i(P) &= 6 \\o(P) &= 14 \\ \text{area} &= 12\end{aligned}$$

$$\begin{aligned}i(P) &= 1 \\o(P) &= 12 \\ \text{area} &= 6\end{aligned}$$

(1899)  
Pick's Theorem. For a polygon  $P$  determined by a sequence of integer grid points,

$$\text{area}(P) = i(P) + \frac{1}{2}o(P) - 1$$
